

Case Study

Shifting Workload to AWS

Overview

A leading Bank in Bahrain with footprints across the GCC region and abroad started shifting their workload to AWS in order to benefit from increased availability, security & innovation while reducing operational costs as part their digital strategy.

Bank soon realized that shifting to AWS was just one part of their digital strategy and they needed to have a high throughput, secure & a cost effective connectivity to AWS data center which should not touch the internet.

Solution

Customer approached Kalaam Telecom who already were their current connectivity providers for their offices in Bahrain with this concern. Kalaam Telecom is an AWS Direct Connect partner having 3 POPs which directly connects it to AWS network backbone i.e. Digital Realty – London, Equinix DX1 Dubai, & DC53 – Bahrain offered a highly available 500 Mbps AWS Direct connect to the bank thus helping them to achieve their objective.

Results

High throughput connectivity via a first and last mile, always-on, monitored, private, secure & cost-effective connection that bypasses the public internet.
